

What is a Mind Map?

Rather than look like normal writing, mind maps look like explosions of writing, or star bursts of thought fragments, or perhaps like someone cut sentences into strips and threw them onto a page. (See Map 1 below, and Map 2, *Mind Mapping*) Their most distinctive feature stems from the fact that they start in the center of an empty page with a key phrase, issue or question. It is to this organizing theme that the map maker returns over and over again. As ideas come up, they are recorded radially, traveling outwards from the center. Lines are used to connect these thoughts together and record the branching and forking that takes place. Every time a train of thought is exhausted, the map maker jumps back to the center and begins again. When new thoughts are related to previous thoughts, they may be inserted near the old location, or lines may run across the page to connect the two ideas together. The result does, in fact, look something like a map. It shows how the map maker got from one idea to another. Its form reveals the nonlinear, jumpy nature of the thinking process. Its contents record the brain's wonderful ability to make connections between ideas, and to create new ones.

Mind maps are thus quite different from typical writing forms that start at the top left of a vertical page and proceed in a linear fashion. Mind maps are most closely related to outlines, but have a very different intent. Outlines express certainty, reflecting the way something is or how it is going to be. They are after-the-fact records that organize thought in a linear fashion. Few people are capable of sitting down and immediately writing a coherent outline that addresses a complex issue. Making a mind map logically precedes the making of an outline. Mind maps have their focus on revealing the structure of the thinking process in real time. Mind maps are organic and allow the structure to reveal itself.

While maps can be used for communication, they are better suited to creative thinking tasks like idea generation and pattern recognition. They are superb for asking questions and revealing connections between seemingly unrelated ideas. In the information age, or rather, the deluge of information age, mind maps provide life buoys to help stay afloat.

## Why Mind Map?

There are many reasons to use mind maps. (See Map 3, *Why Mind Map?*) When addressing an issue they may be used: to reveal your thinking to yourself and perhaps to others; to flesh out the components of the subject; to figure out what is going on; to remember what you know about something, and to explore what you don't know; to contextualize a situation, problem or need; to explore what is left out, taken for granted, assumed, overlooked, or intentionally obscured; to find patterns, recurring themes, surprising connections; to explore where action is needed, or a new design might make a contribution; to reveal conventional wisdom, then to question it; to use as a tool that can be tentative, exploratory, and not draw definitive conclusions; to hang out with ideas; to organize thoughts prior to presenting them in a linear format such as an essay or a speech.

In *The Mind Map Book*, Tony Buzan has championed mind maps for studying, remembering and learning. Many of his examples show notes taken from a lecture, or maps made from memory in preparation for an exam. He makes a wonderful observation when he says, "Neat notes are messy, conceptually. Messy notes (mind maps) are neat conceptually." By this he means that most students try to take notes going from the top of the page to the bottom. While they may be very neat, they don't convey the structure of the lecture. Even students who try to take notes in an outline form rarely succeed in capturing the overall concepts that are being conveyed. On the other hand, notes taken from a mind mapping mode may look incredibly messy, but the overall structure of the lecture can easily be discerned. After class, mind maps can be used to reconstruct the entire lecture.

Others have championed mind maps as a means to organize thoughts prior to writing essays or creative fiction. In English classes I have heard this activity referred to as cluster diagramming, or webbing.

At Stanford, we use maps to help teach design. My students use mind maps to explore need areas to better understand projects they are working on. We also ask them to mind map reading assignments. The intent here is not to record or duplicate the content of the author's message, but rather to reveal their thinking about the material, to ask questions and stimulate making connections to their own ideas and memories. When they have done this, they are well prepared to actively participate in class discussions.

Mind maps can be private or public. Maps can record personal thinking done with no intention of being shared. They can be made in private, but knowing that they will be shared with others. They can be made in private, then reorganized and redrawn for others. Or maps can be the result of a team working on a problem together.

To summarize, mind maps can be used when persons want to do any of the following activities:

### **To learn**

- To record a talk or lecture
- To prepare for a talk or paper
- To study for an exam
- To ask questions
- To exercise the brain

### **To generate creative ideas**

- To get started quickly
- To brainstorm alone, or with others
- To search for patterns and connections
- To search for what is missing
- To speculate: to ask, "what if?"
- To reveal and explore personal values
- To dream and create a personal vision
- To merge poetry and design
- To "walk on a moonbeam" (Einstein)

### **To communicate**

- To reveal the nature of your thinking to others
- To demonstrate a structure or pattern to others
- To organize your thoughts for a talk
- To record a meeting
- To generate enthusiasm and involvement

### **To make decisions**

- To get everyone's input
- To analyze a problem
- To get organized, or organize information
- To separate the important from the extraneous
- To be sure you are working on the right problem
- To reach a consensus or a vision
- To record everyone's ideas in one place

## Getting Started

### Media

While maps can be done on letter sized plain white copy paper, the process is enhanced by having more space to work on. Treat yourself to large sheets of quality paper. 11”x17” or A3 is a nice size because it can be easily photocopied and, folded in half (or Z folded), it can fit in normal notebooks. Beyond this, the only the limit is the size of your biggest table, or wall. People tend to look at maps over and over again. Maps are often hung up for reference or review by others. It is a good idea to use high quality paper that will hold up to repeated use.

My philosophy regarding materials is always to use the best possible. To some extent this is at odds with the non precious mind-set that a mind mapper needs to adopt while exploring an idea. Bigger sheets of paper have more white space, which can be intimidating. If this is a concern for you, start with small sheets of paper. It is always OK to add on paper any time an idea is about to run out of room.

I advocate the use of ink pens rather than pencils. Pencils encourage erasing, which is both unrequired and a waste of time. Since “being correct” isn’t an objective of creative mind maps, there is no need to erase. Quite the reverse, it is really useful to record the entire thinking process including dead ends and intuitive leaps. Maps and drawings done with pens also are more legible and photocopyable than those done with pencils. Black pens work best. A later section will explore the possibilities that arise when color is utilized.

### Space

Mind mapping doesn’t require a special space. It should simply be pleasant to be in and well lit. Ordinary chairs and solid tables are fine. The table should support working at the desired scale.

If several people are going to work on the map, there must be room for everyone to reach the map comfortably. They don’t have to be able to reach the map from one side—they can be distributed around it. Maps don’t have to have one side up. They can have no sense of gravity whatsoever. This may make them hard to read, but it allows people to come at the issue from all directions. The map can be redrawn with a single orientation later.

### Time

You need as much time as is appropriate for the task. A one minute map can greatly improve a 15 minute essay. A thoughtful one hour map will make a useful contribution to any project. An all day map making session may be appropriate for a research group trying to summarize the status of a project, or deciding where to allocate resources.

It is best if you can get all your main thoughts onto a map in one work session. It is hard to come back to a half finished map and pick up both the nature and spirit of a train of thought. Your first attempt at a map doesn’t have to be perfect. One of the nice features of maps is that you can always come back and add more ideas. As we will see, maps require a certain level of richness in order to become useful. This takes time. Start a map only when you will have enough time to finish it.

## Basic Principles

The basic principles of mind mapping are: (see Map 4, *The How of Mind Mapping*)

- 1 Create a Center Statement.
- 2 Develop ideas radially outward.
- 3 Capture ideas quickly.
- 4 Use lines to show connections.
- 5 Create train-of-thought structures.
- 6 Follow an idea as far as it will go.
- 7 Work from the known to the unknown.
- 8 Return to the center when ideas are exhausted.
- 9 Increase density to create richness.
- 10 Avoid being judgmental.
- 11 Have fun with the form.

**1. Create a Center Statement.** The title in the center should state the topic, issue or question that is being addressed. The key thing about the center statement is that you will be continually returning to it. Not only will you be returning to it, but you will be returning to it when you have run out of things to say during your previous stream of thought. So this center statement should be something that you really want to come back to. If you simply want to explore a topic, write it down. In the attached example, “Mind Mapping,” written big and bold, indicates clearly what the map is going to be about. When your issue is an aspect of a bigger topic, write the aspect. These titles may be simple and straight forward, or snappy according to your preference. If you address issues that excite you, fascinate you, or that you can generate some emotion about, making a map will be fun. The best maps are maps you want to make. The title should foster this enthusiasm.

The center statement may also be a whole sentence. Problems are often best written this way. I’ll say more about this later. Likewise, If you are addressing a specific question, write the question. Questions or complete sentences tend to tighten up the exploration and give a map more focus.

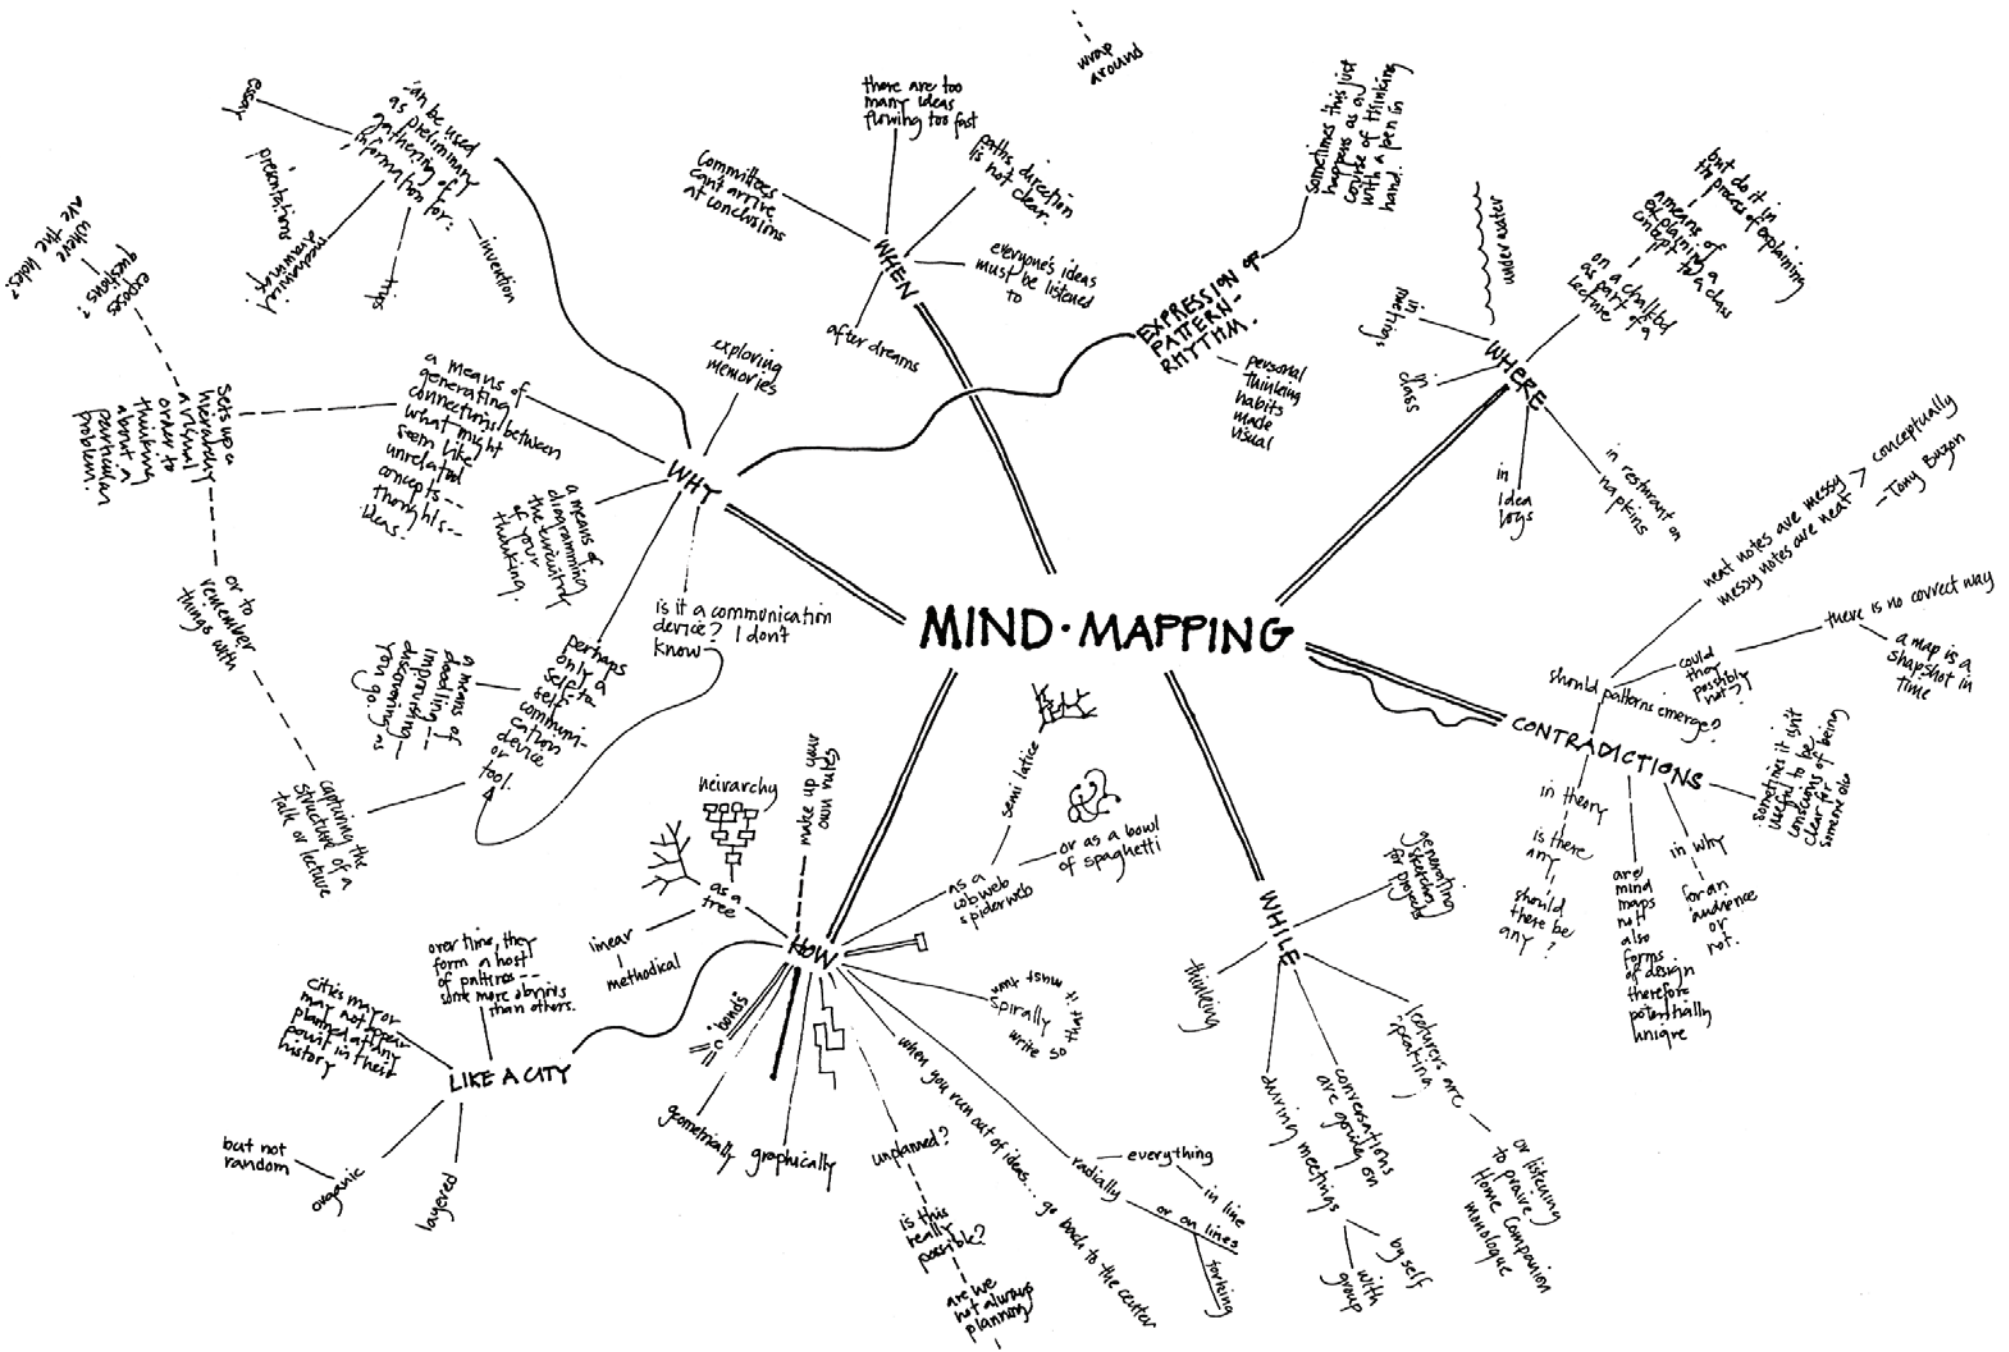

The beauty of writing the issue in the center of the page is that you are no longer facing a blank sheet of paper. When you start at the top, you are still facing an empty page. Worse, the empty page is really demanding that the most logical next idea be written next. When you start in the center, the paper is already messed up. Furthermore, it doesn’t matter where you go next. This makes it much easier to get going. The ice is truly broken.

**2. Develop ideas radially outward.** The next step is to look at this statement, think of the first thing you want to say, draw a line away from the statement and say it. When I start, sometimes I look at the center and realize that there are several categories that will need to be addressed. In our own example, these were the obvious ones: how, where, when, and why do we mind map? I could draw several lines out in different directions, and write these words down. I find this often leads to organization problems because I can’t predict how much room each issue will require. So I often put them down in a clump, or take notes on scratch paper so I won’t forget them. That way, when I address the next issue I can put the key word in a location that provides enough room to explore it.

**3. Capture ideas quickly.** Complete sentences aren’t required. Key-words, phrases and even quick sketches, drawings, diagrams and symbols are fine. Ideas often come faster than you can write them down. The trick is to record them well enough to remember what you were thinking. When you are done you can go back in with a fine pen and clarify your thoughts or add detail. Usually I find that when I am past this first level and into a sub-issue like “Why Mind map?” I am off and running. The urge to be even more organized and think of still finer categories is no longer with me. I’m sure everyone differs on this. After I brainstorm many topics I realize, “Oh, note-taking and studying for an exam are related, they both have to do with learning.” So I could have had a subcategory named learning. This is the beginning of the pattern recognition stage.

**4. Use lines to show connections.** As ideas come, they flow outward. As you think of related ideas, draw a line from the previous idea and write it down. The lines indicate the connections. Whether they are obvious or not, our minds work in metaphorical leaps. It is often interesting and valuable to see where ideas came from. You can use different kinds of lines: fat ones, thin ones. One of my students, Peter MacDonald, hit upon using double lines to show emphasis. His maps looked like super highways with interchanges and arterial feeders. Lines can connect clumps of words, or they can branch off the other lines. There are no correct rules. You can make your own. Wavy lines can indicate uncertainty. Dotted lines metaphorical leaps. A long line can run across a distance, leaping other lines in the way, to connect distant ideas together, or simply to find room to add more thoughts.

**5. Create train of thought structures.** This continual connecting and branching reveals a structure of thought. The solid collection of lines clearly indicate how the ideas flowed from one to another.

**MIND-MAPPING**

**WHEN**

- there are too many ideas swirling too fast
- paths direction is not clear.
- everyone's ideas must be listened to
- Committees can't arrive at conclusions
- after dreams
- exploring memories
- invention
- can be used as preliminary information for:
  - ideas
  - speculations
  - predictions
  - goals

**WHY**

- a means of generating connections between what might seem like unrelated concepts... through ideas.
- a means of communicating the uncertainty of thinking.
- perhaps only useful as a communication device
- is it a communication device? I don't know
- perhaps only useful as a communication device
- a means of communicating the uncertainty of thinking.
- sets up a hierarchy a visual order to thinking about a particular problem.
- or to "calculate" things with

**HOW**

- make up your own rules
- hierarchy as a tree
- linear methodical
- as a web of interrelated
- semi-logic
- or as a bowl of spaghetti
- spiral
- when you run out of ideas... go back to the center
- geometrically
- graphically
- unplanned?
- is this really possible?
- are we not always planning?
- over time they form a host of patterns - some more obvious than others.
- cities may or may not plan - their power is their history
- layered
- organic
- but not random

**LIKE A CITY**

- layered
- organic
- but not random

**WHERE**

- personal thinking habits made visual
- EXPRESSION OF PATTERN-RHYTHM
- in a notebook
- in idea logs
- no pictures
- in retirement
- next notes are messy
- messy notes are neat
- conceptually
- Tony Burgess
- should patterns emerge?
- could they possibly not?
- there is no correct way
- a map is a snapshot in time
- something it isn't useful to be clear if it isn't meant to be

**CONTRADICTIONS**

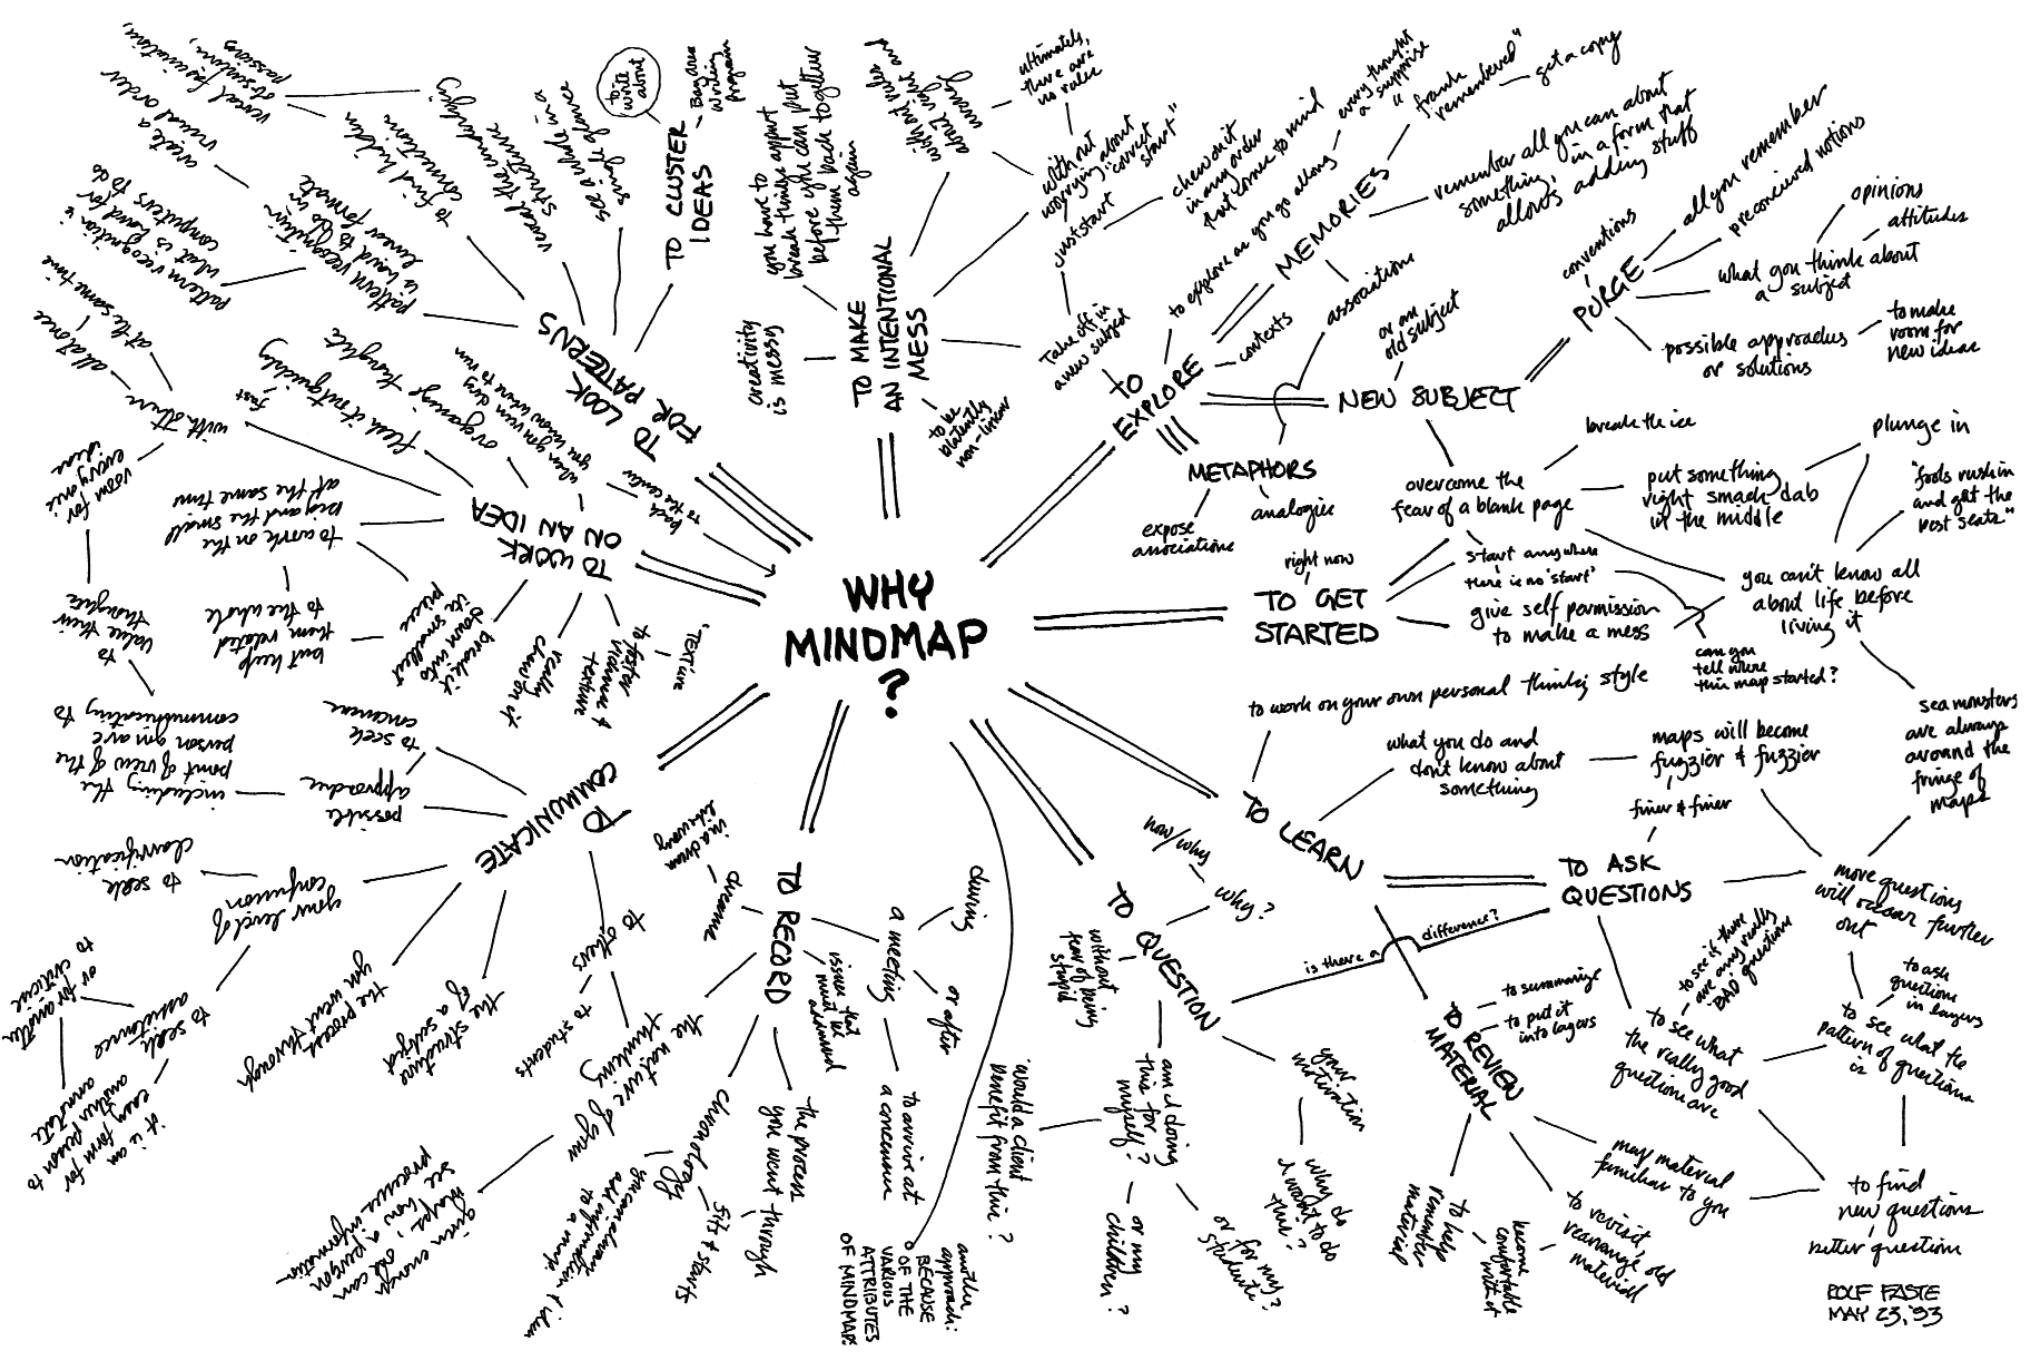

- in theory
- is there any?
- should there be any?
- in why
- are mind maps not also forms of design therefore potentially unique
- for an audience or not.
- generating ideas for groups
- leaders etc
- conversations are going on
- by self
- with group
- driving machines
- or listening to passive
- Home Companion
- monologue

**WHILE**

- thinking
- everything in line or on lines
- or on lines
- sorting
- radically
- is this really possible?
- are we not always planning?

**6. Follow an idea as far as it will go.** Sooner or later, ideas come to an end. At some point I tend to run out of gas, or I have really said enough about that issue, or have gone thoroughly off the track, or gotten to the point where I have nothing but questions. That's the time to stop the train.

**7. Work from the known to the unknown.** Questions are a good place to wind up. Because we tend to work from the known to the unknown, it is normal to have questions at the fringe of the map. Knowledge becomes less certain and rather fuzzy at the edges, just like a 17th century world map. Questions are a great way to summarize an idea chunk and provide a good place to stop.

**8. Return to the center when ideas are exhausted.** When you have finished a thought, go back to the center. If you have already have another category in mind, you can begin on that. If not, look at the center idea until you think of another issue to explore. In my example, I came back to "Where to mind map?," and I was off and running again. Repeat the cycle of coming to the center and starting over until you have exhausted your thoughts on the subject or just plain run out of room. Note that if you really need more space you can tape on an extension.

**9. Increase density to create richness.** Interesting and insightful maps occur when a certain density of ideas is achieved. Density creates a critical mass—the opportunity for fission and fusion of ideas and concepts. When there are a lot of ideas, they jostle each other and bounce off each other—they break apart and re-combine in unexpected and delightful patterns.

Map 6 shows four maps done by a student during weeks 2, 3, 4 and 6 while taking a class which explores human need. Each one concerns a possible design project. The first explores an issue raised while spending time with Paramedics, i.e., Inability to Breathe. The others continue with Windsurfing, First Aid, and Self Defense. These maps show a clear and intentional progression from simple and elementary to dense and rich. The first map might be appropriate for communicating an idea to someone else, but is not rich enough to generate new insights about the issue of breathing. In remarkable contrast, the last map is far more likely to reveal a multiplicity of fruitful approaches to his problem. It is also far more interesting for a reader to study—the density of ideas creates an involvement with the thinking process itself.

A wonderful feature of mind maps is that you can go back into a map and use the interstitial spaces to record new ideas and insights. Often increasing the density can turn a ho-hum map into an exciting one (see Map 7). Achieving such density takes time, which is why it is important to commit a sufficient amount of time to the effort.

**10. Avoid being judgmental.** In any creative process, premature criticism kills ideas before they even have a chance to breathe. Problem solving sessions should not tolerate critical comments while ideas are flowing. This applies to mind mapping just as it applies to brainstorming. It should be an expressive, exploratory activity. Mind maps are best when free flowing, speculative and uncensored by our judgmental self.

At Stanford we characterize the creative process with the acronym "ETC." Professor Bob McKim coined this phrase which stands for Express, Test, Cycle. The key idea is to separate creative thinking (Expressing Ideas) from judgmental thinking (Testing Ideas). There should be no censorship, testing or judging allowed while in the expressive, idea generating phase of thinking. Once we have a large number of ideas (or solution candidates), we can stand back, be objective, and make judgments about our ideas. If we have possible solutions to our problems, great. If not, we Cycle again and begin another Express phase.

**11. Have fun with the form.** Mind maps often exhibit the map maker's sense of aesthetics and playfulness (see Map 8). People who make a lot of maps often become very creative in finding new forms that help them communicate their ideas, or simply make them more fun to do. We will discuss some of these forms later as they can be quite useful.

And now it's time to make some maps!
